Course: Machine Learning Foundations
Unit 1: Introduction to Machine Learning
Supervised learning trains predictive models from labeled training examples.
Feature engineering transforms raw observations into numerical representations.

Unit 2: Optimization with Gradient Descent

Gradient Descent is an optimization algorithm that minimizes the Loss Function.

The Learning Rate determines the step size taken along the negative gradient vector.

Unit 3: Deep Neural Networks

Artificial Neural Networks compose non-linear activation layers to model complex repres

Backpropagation computes partial derivatives using the mathematical chain rule to upda
